

- 1.1 square
- 1.2) rectangle
- 1.3) triangle
- 1.4) rhombus
- 1.5) heptagon
- 1.6) kite
- 1.7) circle/oval
- 1.8) octagon
- 1.9) trapezoid
- 1.10) regular pentagon

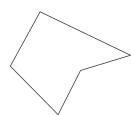

question 2

polygon

polygon

polygon

not polygon

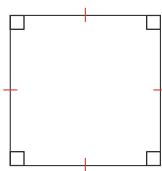

not polygon

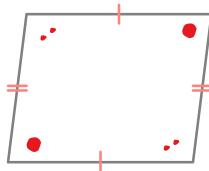

non-polygon

- 3.1) Yes, all the shapes consist only of straight sides and are closed 2D shapes
- 3.2) left side - all sides are the same length
- 3.3) Polygons whose sides are not of equal length
- 3.4) Yes, both have 5 straight sides
- 3.5) regular hexagon; hexagon The left side, hexagon with sides all of equal length and the right side hexagon whose sides are not of equal length

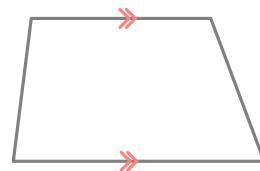

Question 4: Name the shape by looking at the properties given.

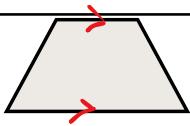

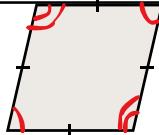

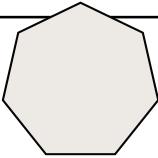

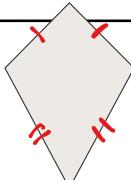

square

parallelogram

trapezoid

| shape | how many curved sides how many straight sides | characteristics | regular or irregular |
|---|---|--|---|
|  trapezium | curved sides: 0 straight sides: 4 | • one pair of opposite parallel | irregular |
|  rhombus | curved sides: 0 straight sides: 4 | • four sides of equal length • 2 pairs of opposite angles are equal | irregular (the angles must also be equal) |
|  heptagon | curved sides: 0 straight sides: 7 | • 7 straight sides of equal length | irregular |
|  kite | curved sides: 0 straight sides: 4 | • 2 pairs of adjacent sides of equal length | irregular |

6.1) Both consist of four straight sides

6.2) A square has four equal angles, a rhombus has two pairs of opposite angles equal.

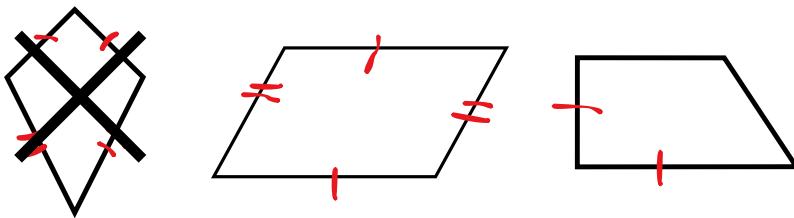

6.3) similarity: both have two pairs of opposite sides of equal length:

difference : rectangle has four angles of equal size and parallelogram has two pairs of opposite angles of equal size

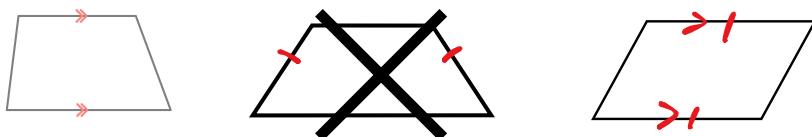

6.4) difference: the sides of a regular hexagon are the same length and the sides of a hexagon are not the same length

similarity: both consist of 6 straight sides and 6 vertices

7.1) Select the shapes where it is indicated that adjacent sides are of equal length. Mark with a cross.

7.2) Which shape would fit the property: one pair of opposite sides equal in length, but not parallel.

8.1) B and D

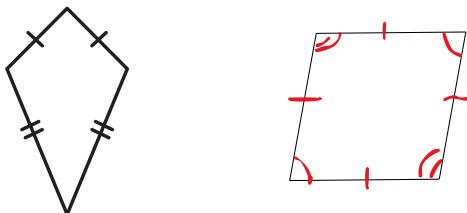

8.2) A in C

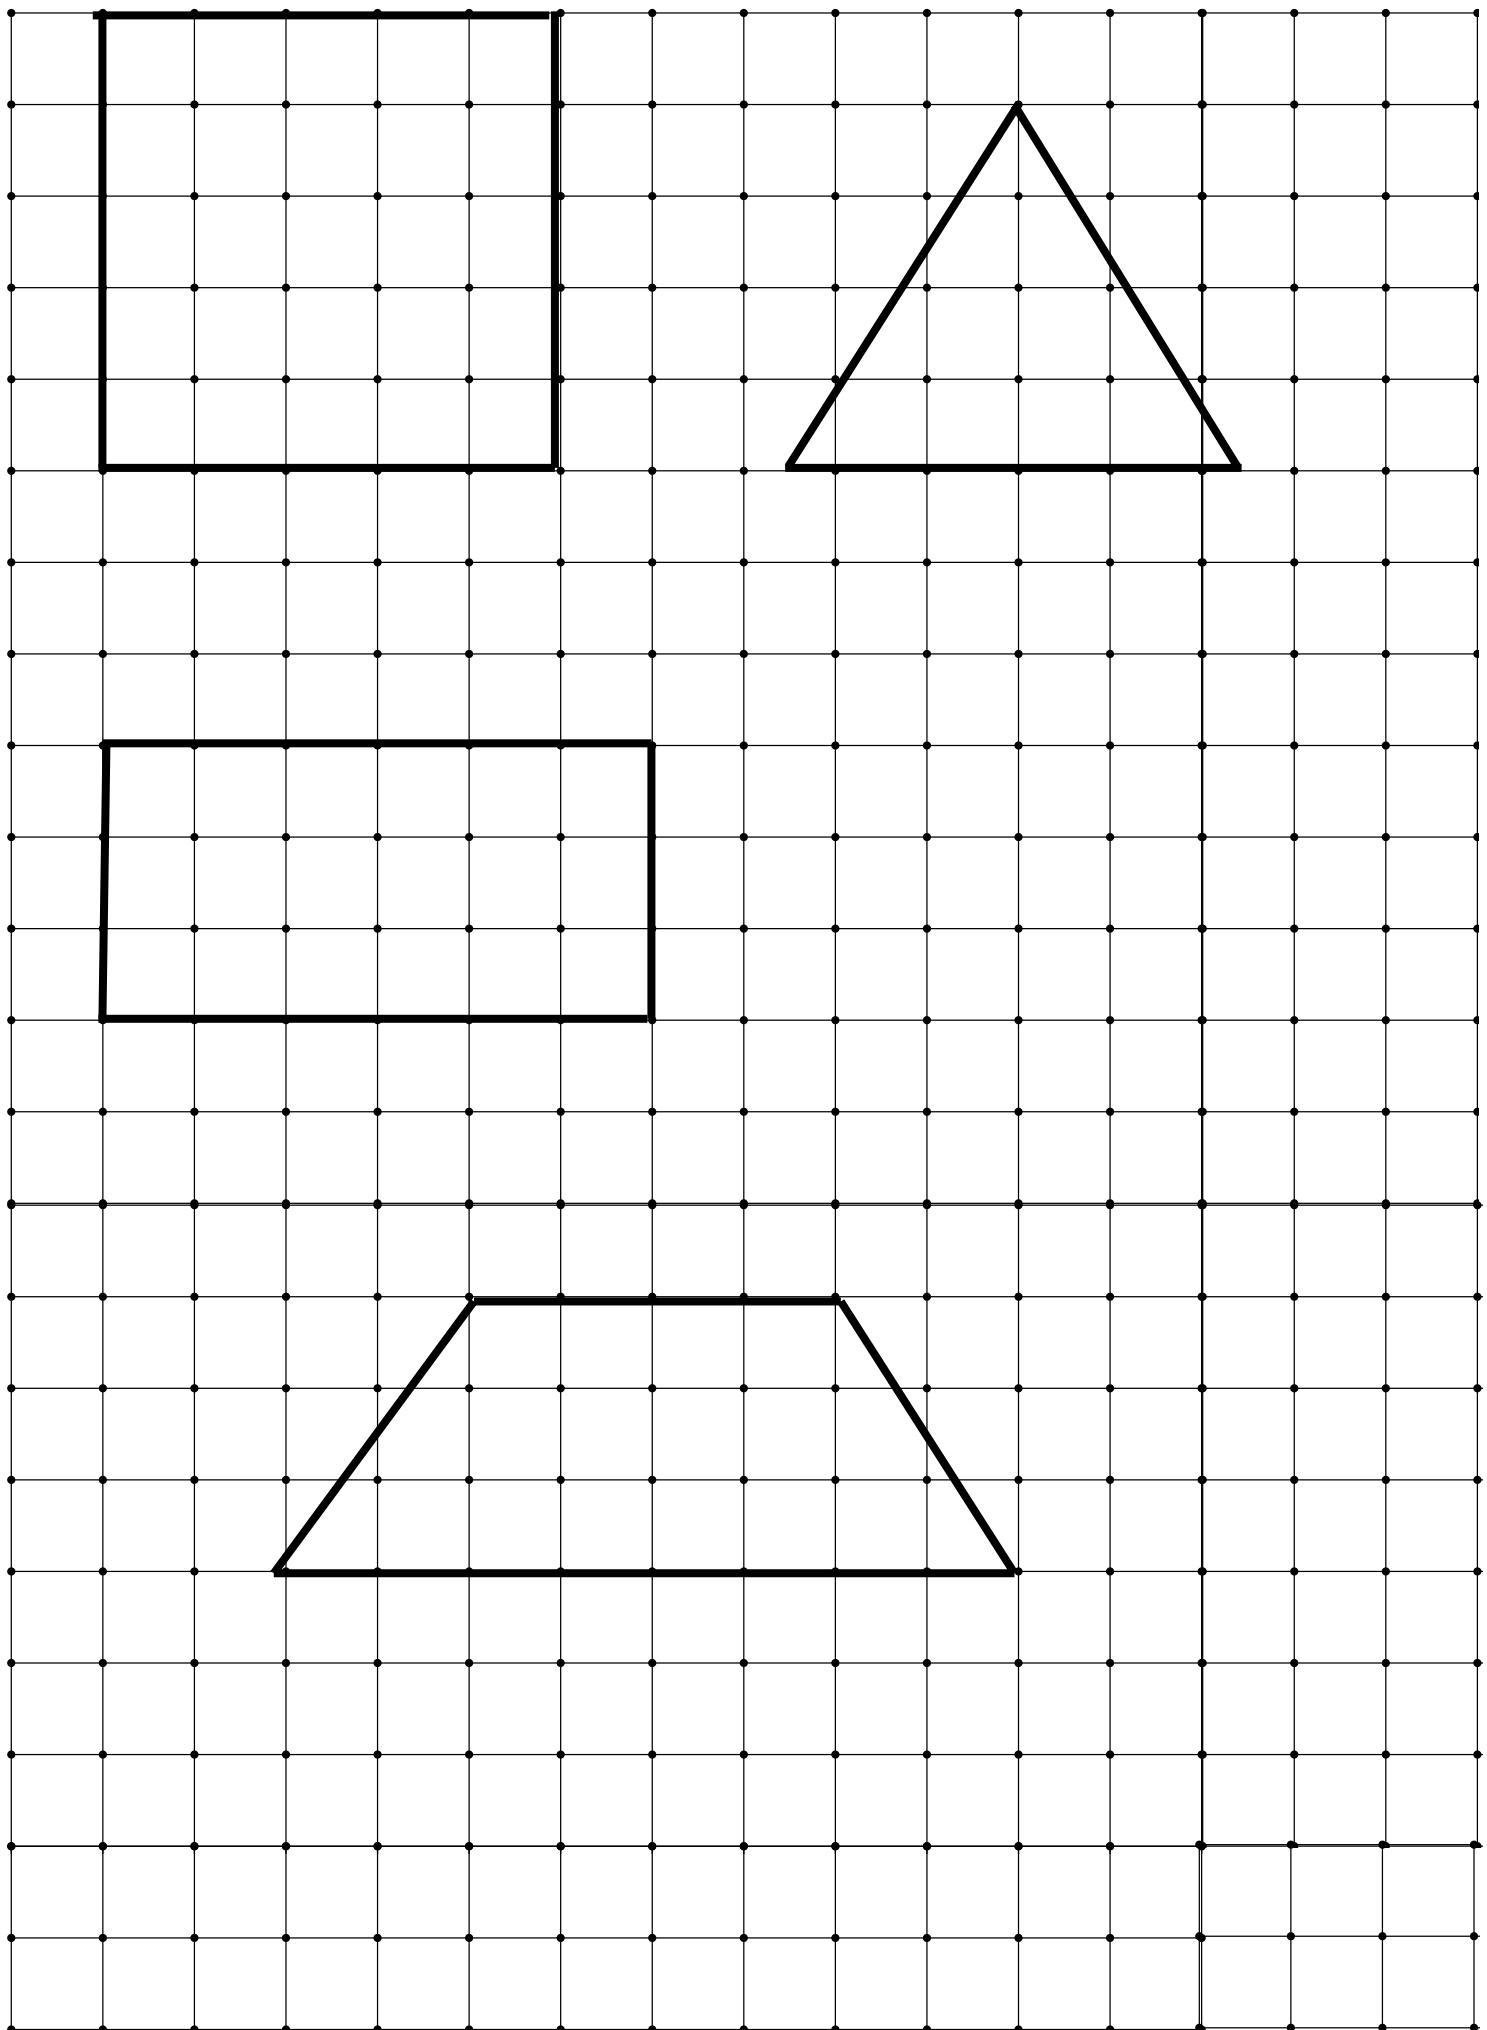

8.3) This is not a closed form

8.4) C

8.5) A

8.6) No, it is a 3D figure, not a 2D shape

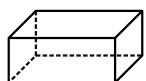

10.1) Write the base of each 3D figure below.

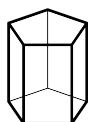

circle

rectangle

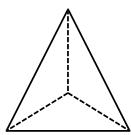

square

pentagon

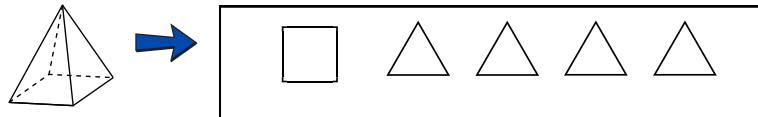

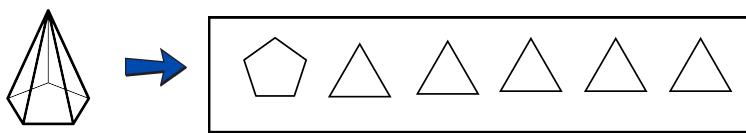

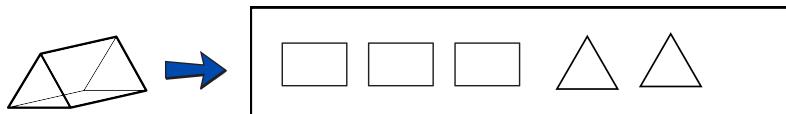

circle

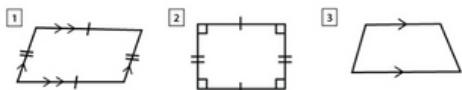

triangle

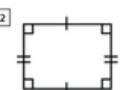

10.2) Draw which 2D shapes will build the 3D figure.

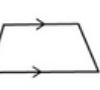

Question 11: Name each shape

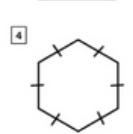

1. parallelogram

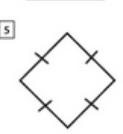

2. rectangle

3. trapezoid

4. hexagon

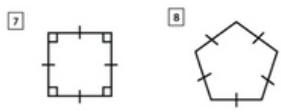

5. square/rhombus

6. hexagon

7. square

8. pentagon

Question 12: Indicate how many vertices and straight sides each shape has.

vertices

straight sides

2 4 4

3 4 4

4 6 6

1 4 4
